Efficient Performance
Innovative Technology
Reliable Quality and
Service

YEOSHE HYDRAULICS CO.,LTD.

Type code series 52

A

1

PA10VO series 52 and 53

- For machines with medium pressure requirements
- Sizes 10 to 140
- Nominal pressure 250 bar (3600 psi)
- Maximum pressure 315 bar (4550 psi)
- Open circuit

Features

1. Variable pump with axial piston rotary group in
2. swashplate design for hydrostatic drives in open circuit.
3. Flow is proportional to drive speed and displacement.
4. The flow can be infinitely varied by adjusting the
5. swashplate angle.
6. Stable bearing for long service life
7. High permissible drive speed
8. Favorable power-to-weight ratio – compact dimensions
9. Low noise
10. Excellent suction characteristics
11. Electrohydraulic pressure control
12. Power control
13. Electro proportional swivel angle control
14. Short control times

Technical data

Hydraulic fluids

When using environmentally friendly hydraulic fluids, the relevant technical data and seal limitations must be observed. Please contact us for details. When ordering, please specify the hydraulic fluid to be used.

Operating Viscosity Range

For optimal efficiency and service life, we recommend selecting the operating viscosity (at operating temperature) within the following optimal range.

vopt = Optimal operating viscosity : 16 to 36 mm²/s

Please refer to the tank temperature (open circuit).

Viscosity Limits

Under critical operating conditions, the following values apply:

$v_{min} = 10 \text{ mm}^2/\text{s}$

- Permissible for short periods ($t \leq 1 \text{ min}$)
- Maximum permissible case drain temperature: 115°C

Please note that certain areas (e.g., the bearing area)

must also not exceed the maximum case drain fluid temperature of 115°C .

The oil temperature in the bearing area is approximately 5K higher than the average case drain fluid temperature.

$v_{max} = 1600 \text{ mm}^2/\text{s}$

- Permissible for short periods ($t \leq 1 \text{ min}$)
- During cold start
($p \leq 30 \text{ bar}$, $n \leq 1000 \text{ rpm}$, $t_{min} -25^\circ\text{C}$)

Depending on the installation, special measures must be taken when operating between -40°C and -25°C .

For more information on low-temperature operation, please contact YEOSHE.

Selection diagram

Notes on Selecting Hydraulic Fluid

To select the proper hydraulic fluid, it is necessary to determine the operating temperature based on the ambient temperature. In an open circuit, this refers to the tank temperature.

Hydraulic fluid should be selected so that it operates within

the optimal viscosity range (vopt) at the expected operating temperature. Please refer to the shaded area in the selection chart. We recommend choosing a fluid with a higher viscosity grade appropriate for the given conditions.

Example :

At an ambient temperature of $X^\circ\text{C}$, the operating temperature in the tank is 60°C .

Within the optimal viscosity range (vopt; shaded area), this corresponds to viscosity grades VG 46 to VG 68; in this case, VG 68 should be selected.

Hydraulic Fluid Filtration

The finer the filter element, the higher the fluid cleanliness—and the longer the service life of the axial piston unit.

To ensure the reliable performance of the axial piston unit, it is essential to perform a comprehensive analysis of the hydraulic fluid to determine the level of solid particle contamination. This assessment should confirm whether the cleanliness meets the ISO 4406 standard.

A minimum cleanliness level of ISO 4406 class 20/18/15 is required.

When operating hydraulic fluid at elevated temperatures (from 90°C up to a maximum of 115°C), a higher cleanliness level of at least ISO 4406 class 19/17/14 is required.

If the specified cleanliness levels cannot be achieved, please contact us.

Important Note

The case drain temperature is influenced by pressure and input speed and is always higher than the tank temperature. However, the temperature at any point on the component must not exceed 115°C .

When determining bearing viscosity, the specified temperature difference on the left side must be taken into account.

If the above conditions cannot be met due to extreme operating parameters, please consult us.

Technical data

A

9

PA10VO series 52 and 53

Operating Pressure Specifications

- Pressure at service line port B
- Nominal pressure p_{nom} _____ 250 bar
- Maximum pressure p_{max} _____ 315 bar
 - Single operation duration _____ 2.5 ms
 - Total operating time _____ 300 hours
- Minimum pressure _____ 10 bar (high-pressure side) _____ 10 bar (absolute pressure)¹⁾
- Pressure change rate RA_{max} _____ 16,000 bar/s

Suction port S (inlet) pressure

- Minimum pressure $P_{S min}$ _____ 0.8 bar (absolute pressure)
- Maximum pressure $P_{S max}$ _____ 5 bar¹⁾

Case Drain Pressure

The maximum allowable case drain pressure (at ports L, L1) must not exceed 0.5 bar above the inlet pressure at port S, and in any case not more than 2 bar.

- $P_{L max abs}$ _____ 2 bar

Maximum Permissible Speed (Speed Limitation)

An increase in the inlet pressure p_{abs} at suction port S is required, or operation must be within $V_g \leq V_{gmax}$.

Definition

- Nominal pressure P_{nom}
The nominal pressure corresponds to the maximum design pressure.
- Maximum pressure p_{max}
The maximum pressure corresponds to the operating pressure within the single operating period. The total of the single operating periods must not exceed the total operating period.
- Minimum pressure (high-pressure side)
Minimum pressure on the high pressure side (B) that is required in order to prevent damage to the axial piston unit.
- Minimum pressure (inlet) open circuit
Minimum pressure at suction port S (inlet) that is required to prevent damage to the axial piston unit. The minimum pressure depends on the speed and displacement of the axial piston unit.
- Rate of pressure change RA
Maximum permissible pressure build-up and pressure reduction speed with a pressure change over the entire pressure range.

$$\text{Total Operating Time} = t_1 + t_2 + \dots + t_n$$

- 1) The values are applicable:
 at absolute pressure $p_{abs} = 1$ bar (15 psi) at suction port S
 — for the optimum viscosity range from $v_{opt} = 36$ to 16 mm²/s (cSt)
 — with hydraulic fluid based on mineral oils

- 2) See diagram on page 11 at speed increase up to $n_{max adm}$.

- 3) The data are valid for values between the minimum required and maximum permissible rotational speed. Valid for external excitation (e.g. diesel engine 2 to 8 times the rotary frequency; cardan shaft 2 times the rotary frequency). The limit value is only valid for a single pump. The load capacity of the connection parts must be considered.

- 4) Higher rotational speeds on request.

Notice

Exceeding the maximum permissible values or falling below the minimum permissible values may result in loss of function, shortened service life or complete destruction of the axial piston unit. We recommend checking the loads by testing or calculation/simulation and comparing with the permissible values.

DR – Pressure controller

The pressure control limits the maximum pressure at the pump output within the pump control range. The variable pump only supplies as much hydraulic fluid as is required by the consumers. If the operating pressure exceeds the target pressure set at the pressure valve, the pump will regulate towards a smaller displacement. The pressure can be set steplessly at the control valve.

Static characteristic

(at $n_1 = 1500 \text{ rpm}$; $t_{\text{fluid}} = 120^\circ\text{F}$ (50°C))

¹⁾ In order to prevent damage to the pump and the system, this setting range is the permissible setting range and it is not allowed to be exceeded. The range of possible settings at the valve are greater.

DRG – Pressure control remotely operated

A

15

PA10VO series 52 and 53

The DRG control valve overrides the function of the DR pressure controller .

A pressure relief valve can be externally piped to port X for remote setting of pressure below the setting of the DR control valve spool. This relief valve is not included in the delivery contents of the pump.

The differential pressure at the control valve is set as standard to 290 psi (20 bar). The control fluid volume at port X is approx. 0.4 gpm (1.5 l/min). If another setting is required (range from 145 to 320 psi (10 to 22 bar)) please state this in clear text.

Static characteristic

(at $n_1 = 1500$ rpm; $t_{\text{fluid}} = 120^\circ\text{F}$ (50 °C))

¹⁾ In order to prevent damage to the pump and the system, this setting range is the permissible setting range and it is not allowed to be exceeded.
The range of possible settings at the valve is higher.

DRF (DFR) DRS (DFR1) – Pressure and flow control

In addition to the pressure control function, a variable orifice (e.g. directional valve) is used to adjust the differential pressure upstream and downstream of the orifice. This is used to control the pump flow. The pump flow is equal to the actual required flow by the consumer, regardless of changing pressure levels.

The pressure control overrides the flow control function.

Note

The DRS (DFR1) valve version has no connection between X and the reservoir. Unloading the LS-pilot line must be possible in the valve system.

Because of the flushing function sufficient unloading of the X-line must also be provided.

Static characteristic

(Flow control at $n_1 = 1500$ rpm;
 $t_{\text{fluid}} = 120^\circ\text{F}$ (50 °C))

- 1) In order to prevent damage to the pump and the system, this setting range is the permissible setting range and it is not allowed to be exceeded.
The range of possible settings at the valve is higher.

EP – Electro-proportional control

Electro-proportional control makes a stepless and reproducible setting of the pump displacement possible directly via the swashplate. The control force of the control piston is applied by a proportional solenoid. The control is proportional to the current (for start of control, see table right).

In a depressurized state, the pump is swiveled to its initial position ($V_{g \max}$) by an adjusting spring. If the operating pressure exceeds 200 psi (14 bar), the pump will swivel from $V_{g \max}$ to $V_{g \min}$ without control by the solenoid (control current < start of control). A PWM signal is used to control the solenoid.

EP.D: The pressure control regulates the pump displacement back to $V_{g \min}$ after the set target pressure has been reached.

A minimum operating pressure of 200 psi (14 bar) is needed for control. The necessary control fluid is taken from the high pressure.

Operating temperature range at valve
-4 °F to 239 °F (-20 °C to +115 °C).

Characteristic EP1/2

Hysteresis < 5 %

Note

The spring return at the controller is not a safety device.

Dirt contamination (contaminated hydraulic fluid, wear or residual dirt from system components) could cause the controller to stick in an undefined position. The volume flow of the axial piston unit will then no longer follow the commands of the operator.

Check whether remedial measures for your application are needed on your machine in order to put the driven consumer in a safe state (e.g. immediate stop).

EK – Electro-proportional control with controller cut-off

A

19

PA10VO series 52 and 53

The variant EK... is based completely on the variant EP...

In addition to the electro-proportional control function, a controller cut-off is integrated in the electric characteristic.

The pump then swivels to $V_{g \max}$ if the control signal is lost (e.g. cable break) and then works with the DRF settings (see page 14). The controller cut-off is only intended for short-term use and not for permanent use if the control signal is lost. If the control signal is lost, the pump swivel times will be reduced by the EK valve.

A PWM signal is used to control the solenoid.

A minimum operating pressure of 200 psi (14 bar) is needed for control. The necessary control fluid is taken from the high pressure.

The $V_{g \max}$ position is maintained by the force of the adjusting spring. To overcome the force of this spring, the solenoid must be subjected to excessive current (I_{res}).

Circuit diagram EK.DF

	Port for
B	Service line
S	Suction line

I_{res} [mA]	> 1200	> 600

For changes in current, ramp times of > 200 ms must be observed.

EP(K).DF / EP(K).DS – EP(K) with pressure and flow control

A hydraulic pressure flow control is superimposed on the electro-proportional control.

The pressure control regulates the pump displacement back to $V_{g \min}$ after the set target pressure has been reached.

This function is super-imposed on the EP or EK control, i.e. the control-current dependent function is executed below the target pressure.

Setting range from 290 to 3600 psi (20 to 250 bar).

For the pressure flow control.

Pressure control has priority over electro-proportional control and flow control.

With flow control, the pump flow can be influenced in addition to pressure control. The pump flow is thus equal to the actual amount of hydraulic fluid required by the consumer. This is achieved using the differential pressure at the consumer (e.g. orifice).

The EP.DS or EK.DS version has no connection between X and the reservoir (load sensing).

EP(K).ED – EP(K) with electro-hydraulic pressure control

A

21

PA10VO series 52 and 53

The ED valve is set to a certain pressure by a specified variable solenoid current.

When a change is made at the consumer (load pressure), the position of the control piston will shift.

This causes an increase or decrease in the pump swivel angle (flow) in order to maintain the electrically set pressure level.

The pump thus only delivers as much hydraulic fluid as the consumers can take. The pressure can be set steplessly by the solenoid current.

As the solenoid current signal drops towards zero, the pressure will be limited to p_{max} by an adjustable hydraulic pressure cut-off (negative characteristic, e.g. for fan drives). A PWM signal is used to control the solenoid.

Static current-pressure characteristic ED

(negative characteristic)

(measured with pump in zero stroke)

Hysteresis static current-pressure characteristic < 45 psi (3 bar).

ED – Electro-hydraulic pressure control

A

22

PA10VO series 52 and 53

The ED valve is set to a certain pressure by a specified variable solenoid current.

When a change is made at the consumer (load pressure), the position of the control piston will shift.

This causes an increase or decrease in the pump swivel angle (flow) in order to maintain the electrically set pressure level.

The pump thus only delivers as much hydraulic fluid as the consumers can take. The desired pressure level can be set steplessly by varying the solenoid current.

As the solenoid current signal drops towards zero, the pressure will be limited to p_{max} by an adjustable hydraulic pressure cut-off (secure fail safe function in case of a loss of power, e.g. for fan drives).

The response time characteristic of the ED-control was optimized for the use as a fan drive system. When ordering, state the type of application in clear text.

Static current-pressure characteristic ED

(measured at pump in zero stroke – negative characteristic)

Hysteresis static current-press. characteristic < 45 psi (3 bar)

Static flow-pressure characteristic

(at $n = 1500$ rpm; $t_{fluid} = 120$ °F (50 °C))

Controller data

Standby standard setting 290 psi (20 bar), other values on request.

Hysteresis and pressure rise _____ $\Delta p < 60$ psi (4 bar).
Control flow consumption _____ 0.8 to 1.2 gpm (3 to 4.5 l/min).

Operating temperature range at valve
-4 °F to 239 °F (-20 °C to +115 °C)

ER – Electro-hydraulic pressure control

A

23

PA10VO series 52 and 53

The ER valve is set to a certain pressure by a specified variable solenoid current.

When a change is made at the consumer (load pressure), the position of the control piston will shift.

This causes an increase or decrease in the pump swivel angle (flow) in order to maintain the electrically set pressure level.

The pump thus only delivers as much hydraulic fluid as the consumers can take. The desired pressure level can be set steplessly by varying the solenoid current.

As the solenoid current signal drops towards zero, the pressure will be limited to p_{min} (stand by).

Static current-pressure characteristic ER

(measured with pump in zero stroke – positive characteristic)

Hysteresis static current-pressure characteristic
 $< 45 \text{ psi (3 bar)}$

Influence of pressure setting on stand by
 $\pm 30 \text{ psi (2 bar)}$

Static flow-pressure characteristic

(at $n = 1500 \text{ rpm}$; $t_{\text{fluid}} = 120^\circ \text{F (50}^\circ \text{C)}$)

Controller data

Standby standard setting 200 psi (14 bar), other values on request.

Hysteresis and pressure rise
 $\Delta p < 60 \text{ psi (4 bar)}$.

Control flow consumption
 0.8 to 1.2 gpm (3 to 4.5 l/min).

Circuit diagram ER..

	Port for
B	Service line
S	Suction line
L, L1	Case drain (L1 plugged)

Technical data, solenoid	ED71	ED72
Voltage	12 V ($\pm 20\%$)	24 V ($\pm 20\%$)
Control current		
Control begin at $q_{g \min}$	100 mA	50 mA
End of control at $q_{g \max}$	1200 mA	600 mA
Limiting current	1.54 A	0.77 A
Nominal resistance (at $68^\circ \text{F (20}^\circ \text{C)}$)	5.5 Ω	22.7 Ω
Dither frequency	100 to 200 Hz	100 to 200 Hz
Actuated time	100 %	100 %

Operating temperature range at valve
 $-4^\circ \text{F to } 239^\circ \text{F (-20}^\circ \text{C to } +115^\circ \text{C)}$

Combination pumps A10VO + A10VO

A

71

PA10VO series 52 and 53

Before finalizing your design request
a certified installation drawing.
Dimensions in mm.

When using combination pumps it is possible to have multiple, mutually independent circuits without the need for a splitter gearbox.
When ordering combination pumps the model codes for the first and the second pump must be joined by a "+".

Order example

PA10VO85DRS/53R-VSC12K04+
PA10VO45DRF/53R-VSC11N00

The tandem pump comprising two identical sizes is permissible without additional supports taking into account a maximum dynamic mass acceleration of $10g$ ($= 98.1 \text{ m/s}^2$).

For combination pumps comprising more than two pumps, the mounting flange must be calculated for the permissible moment of inertia.

Permissible moment of inertia

NG			10	18	28	45	60/63	85	100
Permissible moment of inertia	static	Tm Nm	—	—	890	900	1370	3080	3080
			—	—	89	90	137	308	308
dynamic at $10g$ ($= 98.1 \text{ m/s}^2$)		Tm Nm	—	—	89	90	137	308	308
			—	—	89	90	137	308	308
Mass with through-drive plate	m	kg	—	—	17	24	28	45	45
Mass without through drive (e.g. 2nd pump)	m	kg	8	11.5	14	18	22	34	34
Distance center of gravity	l	mm	—	82	81	95	100	122	122

$m_1 \cdot m_2 \cdot m_3$ Mass of pumps [kg]

$l_1 \cdot l_2 \cdot l_3$ Distance center of gravity [mm]

$$Tm = (m_1 \cdot l_1 + m_2 \cdot l_2 + m_3 \cdot l_3) \cdot \frac{1}{102} \text{ [Nm]}$$

Installation instructions

General

The axial piston unit must be filled with hydraulic fluid and air bled during commissioning and operation. This must also be observed following a longer standstill as the axial piston unit empty via the hydraulic lines.

Especially with the installation position "drive shaft upwards" or "drive shaft downward", attention must be paid to a complete filling and air bleeding since there is a risk, for example, of dry running.

The case drain fluid in the case interior must be directed to the reservoir via the highest case drain port (L1, L2, L3).

For combinations of multiple units, make sure that the respective case pressure in each unit is not exceeded. In the event of pressure differences at the drain ports of the units, the shared drain line must be changed so that the minimum permissible case pressure of all connected units is not exceeded in any situation. If this is not possible, separate drain lines must be laid if necessary.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the suction line and case drain line must flow into the reservoir below the minimum fluid level. The permissible suction height h_s is a result of the overall pressure loss, but may not be greater than $h_{s\max} = 31.50$ in (800 mm). The minimum suction pressure at port S must also not fall below 12 psi (0.8 bar) absolute during operation.

Installation position

See the following examples 1 to 12.

Additional installation positions are available upon request.

Recommended installation positions : 1 and 3.

Below-reservoir installation (standard)

Below-reservoir installation means the axial piston unit is installed outside of the reservoir below the minimum fluid level.

Installation position	Air bleed	Filling
1	L	S + L
2	L ₁	S + L ₁
3 ¹⁾	L ₂	S + L ₂
4	L	S + L

¹⁾ Only series 53

Installation instructions

A

73

PA10VO series 52 and 53

Above-reservoir installation

Above-reservoir installation means the axial piston unit is installed above the minimum fluid level of the reservoir.

To prevent the axial piston unit from draining, a height difference $h_{ES\ min}$ of at least 25 mm is required in installation position 6.

Observe the maximum permissible suction height $h_{s\ max} = 31.50$ in (800 mm).

A check valve in the case drain line is only permissible in individual cases. Consult us for approval.

Installation position	Air bleed	Filling
5	F	L、L1 (F)
6	F	L1 (F)
7 ¹⁾	F	S+L2 (F)
8	F	S+L (F)

¹⁾ Only series 53

Inside-reservoir installation

Inside-reservoir installation means the pump is installed within the minimum reservoir fluid level.

Axial piston units with electrical components (e.g. electric control, sensors) may not be installed in a reservoir below the fluid level.

Installation position	Air bleed	Filling
9	L1	L、L1
10	L1	L、L1

$h_{t\ min}$ Minimum necessary immersion depth (7.87 in (200 mm))

h_{min} Minimum necessary spacing to reservoir base (3.94 in (100 mm))

$h_{ES\ min}$ Minimum necessary height needed to protect the axial piston unit from draining (0.98 in (25 mm)).

$h_{s\ max}$ Maximum permissible suction height (21.50 in (800 mm))

a_{min} When designing the reservoir, ensure adequate distance between the suction line and the case drain line. This prevents the heated, return flow from being drawn directly back into the suction line.

Installation instructions

A

74

PA10VO series 52 and 53

- The PA 10VO pump is designed to be used in open circuit.
- Project planning, installation and commissioning of the axial piston unit require the involvement of qualified personnel.
- Before operating the axial piston unit, please read the appropriate instruction manual thoroughly and completely. If necessary, request these from YEOSHE.
- During and shortly after operation, there is a risk of burns on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e.g. by wearing protective clothing).
- Depending on the operating conditions of the axial piston unit (operating pressure, fluid temperature characteristics may shift).

Service line ports

- The ports and fixing threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid temperature) with the necessary safety factors.
- The service line ports and function ports are only designed to accommodate hydraulic lines.
- Pressure cut-off and pressure control do not provide security against pressure overload. A separate pressure relief valve is to be provided in the hydraulic system.
- The data and notes contained herein must be adhered to.
- The product is not approved as a component for the safety concept of a general machine according to DIN EN ISO 13849.

The following tightening torques apply

Fittings

Observe the manufacturer's instruction regarding the tightening torques of the used fittings.

Fixing screws

For fixing screws with metric ISO thread according to DIN thread according to ASME B1.1, we recommend checking the tightening torque individually according to VDI 2230.

Female threads in axial piston unit

- The maximum permissible tightening torques M₆ may be maximum values for the female threads and must not be exceeded.
- For values, see the following table.

Threaded plugs

For the metal threaded plugs supplied with the axial piston unit, the required tightening torques of threaded plugs M_v apply. For values, see the following table.

Ports Standard	Thread size	Maximum permissible tightening torque for female threads M _{G max}	Required tightening torque for threaded plugs M _v 鎖緊螺絲所需的緊固力矩	Size of hexagon socket of threaded plugs
ISO 11926	7/16-20UNF-2B	40 Nm	18 Nm	3/16 in
	9/16-18UNF-2B	80 Nm	35 Nm	1/4 in
	3/4-16UNF-2B	160 Nm	70 Nm	5/16 in
	7/8-14UNF-2B	240 Nm	110 Nm	3/8 in
	1 1/16-12UNF-2B	360 Nm	170 Nm	9/16 in
